## RESEARCH PROJECTS

- Blurring the Boundary Between Reality and Virtuality: Research on Novel Haptic Devices**
  - Creation and evaluation of a small, lightweight haptic system that uses electrical muscle stimulation (EMS) combined with biomechanical simulation to stimulate multiple muscles simultaneously, providing users with precise directional haptic force feedback [c.11, c.5, w.4]
  - Improvement of the response time limitations of previous thermal haptic devices by using motorized Peltier modules, creating a device capable of providing a high level of realism in situations requiring rapid sensory transitions [c.8, w.1]
  - Development of exemplary VR applications utilizing haptic devices in industrial settings [c.11, c.8, w.4] and VR game content [c.5, c.8, w.1]
- Towards Seamless Walking in Virtual Environments: Redirected Walking (RDW)**
  - Development and usability testing of various haptic systems to enhance the obstacle avoidance capability of RDW technology, overcoming the physical limitations of real-world space, thereby enhancing the seamless walking experience
  - Creation of haptic devices that can provide vestibular stimulation (galvanic, bone conduction vibration, thermal) [c.1, c.3, p.2, pa.1], olfactory stimulation, auditory stimulation [j.2, p.1], and visual stimuli with optical flow [j.1], along with algorithms to determine the optimal type and timing of stimulation
  - Further implementation of algorithms to improve RDW's spatial scalability by predicting user paths through real-time sensing of walking data and deep learning-based user path prediction – responsible for implementing the real-time gait sensor streaming system [p.4]
- Utilizing Haptic Technology for Accessibility**
  - Development and implementation of a hat-shaped haptic device that induces the "Hanger reflex" to expand the field of vision for people with low vision [c.6]
  - Development of an intelligent walker that integrates pressure sensors, linear actuators, and motorized wheels, dynamically changing its form to match the patient's intent and the surrounding environment, aimed at improving rehabilitation performance for patients with lower body motor impairments [c.9, w.2]
- Interactions Between Autonomous Vehicles (AVs) and People**
  - Development and evaluation of a haptic system that activates muscles via EMS based on the content and movement of the vehicle to address motion sickness, a major limitation of VR use in AVs [c.4, w.3]
  - Development and evaluation of an in-car VR locomotion system that allows users to freely explore the environment, rather than simply observing content on predetermined routes [c.10, p.3, cc.1, cc.2]

- Creation and distribution of a comprehensive dataset of AV passengers' real-time needs and biometric signals [c.7]
- Development and design evaluation of an AR-based virtual agent for communication between AVs and pedestrians [c.2]
